# managed mobile connectivity

## mobile internet access – does it need to be expensive and complicated?

**For most businesses, remote working is on the rise. And for employees who are constantly on the move, the need to be able to access a secure internet connection is essential.**

From logging on to the world wide web at a client's office, tapping into WiFi in an airport lounge or cafe, to home broadband and 3G subscriptions – the connectivity options for today's remote workforce are vast. Long gone are the days where employees would clock in at nine and out at five. But the increase in connectivity options brings challenges in deployment, security, service monitoring and support – not to mention the potential hidden costs ready to bite your corporate behind at any given minute.

But maintaining some kind of order over your workforce's mobile internet usage doesn't have to be complicated or expensive. With a fixed price per user per month, you can take back control and implement a mobile management connectivity solution (MMC). →

# managed mobile connectivity

For most businesses, remote working is on the rise. And for employees who are constantly on the move, the need to be able to access a secure internet connection is essential.

## taking back control

As remote working increases, so do the associated costs (and risks) of mobile connectivity. There's the coffee shop day passes, home broadband bills, dongles, smartphones to contend with, not to mention the fraudulent use of unsecure networks. With all these

options available to remote workers, having a clear visibility over how much they're spending and how secure their access methods are is a tricky business, especially when the costs crop up in such haphazard manner and receipts and bills remain buried for weeks in workers' expense reports. This chaotic method, means that we lose track of how much we're spending, and we jeopardise the security of the files and folders our workers are trying to access. Businesses are left with no idea who is accessing what, when or how – or for how much.

Variety is the spice of life but how can you ensure paying for the privilege doesn't end up costing you an arm and a leg? How can you take back control whilst reducing cost, risk and complication? You can reduce risk and cut costs by rolling out a mobile management solution that has the power to:

- Fix the price per user per month for true unlimited 3G and WiFi utilisation
- Provide global broadband access with over 140,000 enterprise-grade Wi-Fi venues, worldwide 3G mobile broadband networks, hotel ethernet and dial-up access.
- Enforce security and mobility policies and control spend across your growing global fleet of laptops, netbooks, and other mobile devices. Deliver the intelligence and reporting capability you need to optimise the quality, security, and cost of your mobile Internet activity.
- Provide the simplest and smartest way for enterprises to deliver and manage remote and mobile access across their globally distributed workforce.

## great... so how does it work?

Elements of the MMC solution are cloud-based. It's a clever piece of kit, which automatically eliminates user interaction and ensures that only set networks are accessible to users, based

on your own corporate policies. This means, your networks remain secure while your costs will take a tumble – as the solution will determine the lowest cost connectivity option

and troubleshoot connection problems before they become a pain in the neck. This in turn will help you strengthen security and cost policies, with timely data and trends.

available and avoid expensive options wherever possible.

The reporting functionality available with many MMC packages provides a helping hand for businesses struggling to juggle too many balls at once. The ability to monitor and view reports on usage can help your business identify issues

In addition to the single point of control across your mobile workforce, your accounts department will be thankful for the streamlined payment system. The billing process works by providing a single bill with connection detail records for all remote and mobile connections, no matter how many providers or access methods are used. So no more month-old expense reports to sift through!
